

Photo. 7. Surface moraine of a glacier on the west side of the D massif. The glacial ice under the lee of a boulder is protected from wind ablation. The boulders receive ample insolation from the right of the picture.

写真 7. D 群西側の surface moraine 中に認められる moraine による氷の削剥の保護の現象. 写真の右手から日射を多く受け, 左手から卓越風を受ける.

Photo. 8. The ground moraine with patterned ground (B massif). Stone stripes scarcely develop in the foreground where the ice had covered moraine until recently.

写真 8. B 山塊を覆う構造土の生じた moraine. 前景の部分は遅くまで氷に覆われていたため, ほとんど構造土は発達していない.
